BASF
The Chemical Company

- A powerful, fast, and convenient way to treat subterranean termites
- Unique “Transfer Effect™”
- Proven colony elimination
- Unique formulation that can be consumed by termites

Pest Control Solutions

BASF
The Chemical Company

“

“With Termidor dusting, you are proactive. You are right onto it, and doing something that you know is going to be done and, literally, dusted.”

Luke Howarth
Sangate Pest Control
Sandgate, QLD

”

- Fast infestation elimination, typically within 2 to 4 weeks
- Proven colony elimination
- Unique formulation that can be consumed by termites
- Control of all subterranean species in Australia

Consistently the fastest way to control termite infestations

With precise application into active termite colonies in virtually any location, **Termidor® Dust** brings the proven **Termidor** efficacy and reliability to a whole new range of locations and situations.

Termidor Dust is the culmination of over 10 years research to find the perfect termite nest elimination product. **Termidor Dust** is applied by Professional Pest Managers directly on to the termites, either inside the home or onto external situations such as trees, fences, landscaping timbers and timber based structures –anywhere termites are likely to exist.

Termidor Dust and Baiting

Termidor Dust is also perfect for treating active termite bait stations. After treatment, the termites carry the dust particles on their bodies and eventually back to the nest (where ever that may be) via the unique “Transfer Effect”. Extensive Australian research proves that it takes as little as 2 to 4 weeks for total termite elimination. This is much faster than expensive baiting systems and will not require numerous Professional Pest Manager visits to achieve success.

The Future Solution

There are two issues with treating a termite infestation. First, you have to stop them in their tracks to limit the amount of damage to your house, and then secondly you have to prevent re-infestation.

Eradication of one termite colony with **Termidor Dust** does not guarantee protection from a future attack by other colonies in the area. Therefore a future control via baiting and monitoring systems to intercept a new potential infestation is recommended. Any further termite activity can be treated with **Termidor Dust**.

For a complete termite solution ask your Accredited **Termidor** Applicator about a **Termidor** residual treated zone around your home, or visit www.termidor.com.au for more information.

Proven Termidor technology

The performance of **Termidor** has been proven and trusted by home owners and pest controllers throughout Australia and around the world, in all types of conditions and in the most difficult to control situations.

Termidor Dust has been extensively tested in both the laboratory and the field against all the major timber feeding subterranean termites in Australia. In all field trial sites, termites have been eliminated from the treated structure and from the central nest when it has been positively identified usually within 2 to 4 weeks after treatment.

Termidor Dust’s unique ‘Transfer Effect’™

Termites are social insects, feeding and grooming each other in large, close-knit colonies – an ideal scenario for the “Transfer Effect” and a key reason why no other termiticide performs as well as **Termidor Dust**. Thanks to this “Transfer Effect” termites do not need to ingest, or be directly dusted in order to die. Dusted termites collect **Termidor Dust** on their bodies thus making each termite a “carrier” of the dust throughout the entire colony. Even termites that have not been directly treated will obtain a lethal dose.

“

“We use Termidor Dust in bait stations and it achieves great results. Termites are eliminated really fast, certainly much faster than traditional baiting systems.”

Stephen Carey
Scarey Critters Pest Control
Warragul, VIC
